SYNTHETIC TEST REPORT FOR SOFTWARE TESTING ONLY

Patient: Sample Patient **Age/Sex:** 42 Y / Male **Date:** 20-Oct-2026 **Ref:** Dr. Demo

MRI LEFT KNEE (PLAIN)

Clinical history: Pain in the left knee for 2 months, worse on climbing stairs.
Technique: Multiplanar, multisequence MRI of the left knee without contrast.

FINDINGS:
• Medial meniscus: Grade II intrasubstance signal in the posterior horn, not reaching the articular surface.
• Lateral meniscus: Normal in signal and morphology.
• Anterior cruciate ligament (ACL) and posterior cruciate ligament (PCL): Intact.
• Medial and lateral collateral ligaments: Intact.
• Mild joint effusion is seen.
• Articular cartilage: Mild thinning over the medial femoral condyle.
• No bone marrow edema. No fracture.
• Patella and quadriceps / patellar tendons: Unremarkable.

IMPRESSION:
1. Grade II intrasubstance degeneration of the posterior horn of the medial meniscus. No meniscal tear.
2. Mild joint effusion.
3. Early chondral thinning of the medial femoral condyle.
4. Cruciate and collateral ligaments intact.

Suggested clinical correlation.
